Does NXS[15] apply to every type of data, or just fast tables?	12

1 Introduction

The ACE format consists of two *types* and many *classes* of data. The data are kept in an ACE Table. The term ACE Table and ACE file are often used interchangeably.

1.1 Types of ACE-Formatted Data

There are two types of ACE-formatted data; simply called Type 1 and Type 2.

Type 1 Standard formatted tables. These tables contain ASCII text and are machine independent; they are readable on every machine.

Type 2 Standard unformatted tables. These tables are binary and can be generated from the Type 1 files. They are more compact and faster to read than the Type 1 ACE Tables but are machine/platform dependent; they are not readable on every machine.

Traditionally Type 2 ACE files were more commonly used because they were smaller in size and faster to read. However due to the fact that they are not portable across machines and platforms they have fallen out of fashion.

1.2 Classes of ACE-Formatted Data

There are many classes of ACE-formatted data:

1. continuous-energy neutron (see Section 4),
2. discrete-reaction neutron,
3. neutron dosimetry (see Section 5),
4. $S(\alpha, \beta)$ thermal (see Section 6),
5. continuous-energy photoatomic (see Section 7),
6. continuous-energy electron interaction,
7. continuous-energy photonuclear interaction,
8. multigroup-energy neutron, and
9. multigroup-energy photoatomic.

Each of these classes of data are described later in this document.

An ACE Table is an entity that contains evaluation-dependent data about one of the many classes of data for a specific material—an target isotope, isomer, or element. For a given ZAID, the data contained on a Type 1 and Type 2 tables are identical. Simulations run with one type of data should produce identical results as those run with the other type of data.

1.3 ACE Libraries

A collection of ACE data tables that derive from a single set of evaluation files are typically grouped together in a “library”—not to be confused from the evaluation library from which they derive. Multiple ACE data tables can concatenated into the same logical file on the computer, although this has fallen somewhat out of fashion due to the large amount of data on each ACE table derived from modern evaluation files. Applications

that use ACE-formatted data should produce the same results regardless of whether the tables are contained in one logical file on the computer or spread across many.

2 ACE Tables

An ACE Table consists of a Header followed by an array (XSS) containing the actual data. The Header and XSS array are the same regardless of whether the ACE Table is Type 1 or Type 2. Each line in a Type 1 ACE Table is 80 characters or less.

2.1 ACE Header

The first section of an ACE Table is the Header. The ACE Header contains metadata¹ about the ACE Table. The Header consists of four parts:

1. Opening,
2. IZAW array,
3. NXS array, and
4. JXS array.

An example of an ACE Table Header (from ¹H in the ENDF71x library) is given in Figure 1 with each part highlighted a different color.

Figure 1: Header example. The (Legacy) Opening (lines 1–2) is in red, the IZAW array (lines 3–6) is in blue, the NXS array (lines 7–8) is in teal, and the JXS array (lines 9–12) is in violet.

Legacy Header Opening There are two slightly different formats for the Header Opening. The most common one found is called here the Legacy Opening and is the one demonstrated in the Header example in Figure 1.

The Legacy Opening consists of several variables given over two 80-character lines. The variables and the Fortran format for reading the variable is given in Table 1

2.0.1 Header Opening

Don't forget the 2.0.1 Header Opening

¹data about the data

Line	Variable	Format	Description
1	HZ	A10	ZAID (see Section 3.1)
1	AW	E12.0	atomic weight ratio
1	TZ	E12.0	temperature
1	—	1X	(blank space)
1	HD	A10	processing date
2	HK	A70	descriptive string
2	HM	A10	10-character material identifier

Table 1: Variables in the Legacy Opening part of the ACE Header.

Line	Variable	Format	Description
1	VERS	A10	version format string
1	HZ	A24	SZAID (see Section 3.2)
1	SRC	???	evaluation source
2	AW	E12.0	atomic weight ratio
2	TZ	E12.0	temperature
2	—	1X	(blank space)
2	HD	A10	processing date
2	N	I10	number of comment lines to follow
3-(N+2)	—	A70	comment lines

Table 2: Variables in the 2.0.1 Opening part of the ACE Header.

There is a limitation to the number of unique ZA IDs for a given ZA; 100 different IDs, in fact, for each class of ACE Table. To overcome this limitation, a new Header Opening was developed in 2013 and updated a few years later to correct some errors.

```

Figure 2: Header Opening example. The Legacy Opening is shown in blue while the 2.0.1 Opening consists of the red and the blue portions.

Note that a Legacy Header Opening can be contained in the comment section of the 2.0.1 Header Opening. This was designed explicitly to allow backwards compatibility while application codes were modified to be able to handle. An example of this is shown in Figure 1. Codes that cannot read the 2.0.1 Header can be told (typically via an

verify correctness

xsdirentry) to start reading the ACE Table several lines after the beginning of the 2.0.1 Header.

provide
reference

Following the Opening of the Header are three arrays, IZAW, NXS, and JXS respectively. They are each described below. Immediately following the JXS array is the XSSarray.

2.1.1 IZAW Array

The IZAW array follows on the lines immediately following the Header. It consists of 16 pairs of ZA's (IZ) and atomic weight ratios (AW). The IZ entries are still needed for $S(\alpha, \beta)$ Tables to indicate for which isotope(s) the scattering data are appropriate.

The 16 pairs of numbers are spread over 4 lines. The Fortran format for reading/writing the numbers on one line is: 4(I7,F11.0).

2.1.2 NXS Array

The NXS array comes on the 2 lines after the IZAW array. The NXS array has 16 integer elements; 8 on each line. The Fortran format for reading/writing the numbers on each line is: 8I9. The first element of the NXS array indicates how many numbers are in the XSS array. The remainder of the NXS array elements (usually) indicate how many of different pieces of data there is.

2.1.3 JXS Array

The JXS array comes on the 4 lines after the NXS array. The JXS array has 32 integer elements; 8 on each line. The Fortran format for reading/writing the numbers on each line is: 8I9. The JXS array contains indices to the XSS array where different pieces of data begins.

The specific definition of the elements of the NXS and JXS arrays are dependent on the class of data in the Table and are defined in the section of this document that describes each class of data.² Note that not all elements of the arrays are (currently) being used, allowing for future expansion.

2.2 The XSS Array

After the ACE Header comes the XSS array. It is typically *very* large with hundreds of thousands of elements. It is broken up into blocks with the blocks being dependent on the class of data that is contained in the table. The description and definition of each of these blocks can be found in the descriptions later in this document.

The data is written with 4 floating-point numbers on each 80-character line. All data in the XSS array can be read using the Fortran format: 4E20.0 for each line.

²See, for example, Table 3 and Table 4.

```

Figure 3: ACE Header with beginning of XSS array for ^1H from the ENDF71x library. Note this uses the 2.0.1 Header with backwards compatibility with the Legacy Header.

3 Unique ACE Table Identifier

This needs to be done.

Each ACE Table needs to have an identifier to uniquely distinguish the data that is contained in the Table.

3.1 Z Aid

3.2 SZAID

With the introduction of the 2.0.1 ACE Header, the identifier was modified to better specify the metastable state of the material as well as expand the available space for identifiers.

The new identifier is referred to as a SZAID³.

³pronounced “ess-ZAID”

4 Continuous-Energy and Discrete Neutron Transport Tables

The format of individual blocks found on neutron transport tables is identical for continuous-energy and discrete-reaction ACE Tables; the format for both are described in this section. The blocks of data are:

1. **ESZ Block**—contains the main energy grid for the Table and the total, absorption, and elastic cross sections as well as the average heating numbers. The ESZ Block always exists. See Section 4.3.1.
2. **NU Block**—contains prompt, delayed and/or total $\bar{\nu}$ as a function of incident neutron energy. The NU Block exists only for fissionable isotopes; that is, if $\text{JXS}(2) \neq 0$. See Section 4.3.2.
3. **MTR Block**—contains a list of ENDF MT numbers for all neutron reactions other than elastic scattering. The MTR Block exists for all isotopes that have reactions other than elastic scattering; that is, all isotopes with $\text{NXS}(4) \neq 0$. See Section 4.3.3.
4. **LQR Block**—contains a list of kinematic Q -values for all neutron reactions other than elastic scattering. The LTR Block exists if $\text{NXS}(4) \neq 0$. See Section 4.3.4.
5. **TYR Block**—contains information about the type of reaction for all neutron reactions other than elastic scattering. Information for each reaction includes the number of secondary neutrons and whether secondary neutron angular distributions are in the laboratory or center-of-mass system. The TYR Block exists if $\text{NXS}(4) \neq 0$. See Section 4.3.5.
6. **LSIG Block**—contains a list of cross section locators for all neutron reactions other than elastic scattering. The LSIG Block exists if $\text{NXS}(4) \neq 0$. See Section 4.3.6.
7. **SIG Block**—contains cross sections for all reactions other than elastic scattering. The SIG Block exists if $\text{NXS}(4) \neq 0$. See Section 4.3.7.
8. **LAND Block**—contains a list of angular-distribution locators for all reactions producing secondary neutrons. The LAND Block always exists. See Section 4.3.8.
9. **AND Block**—contains list angular distributions for all reactions producing secondary neutrons. The AND Block always exists. See Section 4.3.9.
10. **LDLW Block**—contains a list of energy distributions for all reactions producing secondary neutrons except for elastic scattering. The LDLW Block exists if $\text{NXS}(5) \neq 0$. See Section 4.3.10.
11. **DLW Block**—contains energy distributions for all reactions producing secondary neutrons except for elastic scattering. The DLW Block exists if $\text{NXS}(5) \neq 0$. See Section 4.3.11.
12. **GPD Block**—contains the total photon production cross section tabulated on the ESZ energy grid and a $30 \times$ matrix of secondary photon energies. The GPD Block exists only for those older evaluations that provide coupled neutron/photon information; that is, if $\text{JXS}(12) \neq 0$. See Section 4.3.12.
13. **MTRP Block**—contains a list of MT numbers for all photon production reactions. The term “photon production reaction” is used for any information describing a specific neutron-in, photon-out reaction. The MTRP Block exists if $\text{NXS}(6) \neq 6$. See

Section 4.3.3.

14. **LSIGP Block**—contains a list of cross section locators for all photon production reactions. The LSIGP Block exists if $NXS(6) \neq 0$. See Section 4.3.6.
15. **SIGP Block**—contains cross sections for all photon production reactions. The SIGP Block exists if $NXS(6) \neq 0$. See Section 4.3.14.
16. **LANDP Block**—contains a list of angular-distribution locators for all photon production reactions. The LANDP Block exist if $NXS(6) \neq 0$. See Section 4.3.15
17. **ANDP Block**—contains photon angular distributions for all photon production reactions. The ANDP Block exists if $NXS(6) \neq 0$. See Section 4.3.16.
18. **LDLWP Block**—contains a list of energy-distribution locators for all photon production reactions. The LDLWP Block exists if $NXS(6) \neq 0$. See Section 4.3.17.
19. **DLWP Block**—contains photon energy distributions for all photon production reactions. The DLWP Block exists if $NXS(6) \neq 0$. See Section 4.3.18.
20. **YP Block**—contains a list of MT identifiers of neutron reaction cross sections required as photon production yield multipliers. The YP Block exists if $NXS(6) \neq 0$. See Section 4.3.19.
21. **FIS Block**—contains the total fission cross section tabulated on the ESZ energy grid. The FIS Block exists if $JXS(21) \neq 0$. See Section 4.3.20.
22. **UNR Block**—contains the unresolved resonance range probability tables. The UNR Block exists if $JXS(23) \neq 0$. See Section 4.3.21.

4.1 NXS Array

Table 3: NXS array element definitions for NXS ACE Table.

Element	Name	Description
1	—	Length of second block of data (XSS array)
2	ZA	$1000 * Z + A$
3	NES	Number of energies
4	NTR	Number of reactions excluding elastic scattering
5	NR	Number of reactions having secondary neutrons excluding elastic scattering
6	NTRP	Number of photon production reactions
...		
8	NPCR	Number of delayed neutron precursor families
...		
15	NT	Number of PIKMT reaction
16	—	0=normal photon production -1=do not produce photons

Does $NXS[15]$ apply to every type of data, or just fast tables?

4.2 JXS Array

Table 4: JXS array element definitions for JXS ACE Table.

Element	Name	Location Description
1	ESZ	Energy table
2	NU	Fission ν data
3	MTR	MT array
4	LQR	Q -value array
5	TYR	Reaction type array
6	LSIG	Table of cross section locators
7	SIG	Cross sections
8	LAND	Table of angular distribution locators
9	AND	Angular distributions
10	LDLW	Table of energy distribution locators
11	DLW	Energy distributions
12	GPD	Photon production data
13	MTRP	Photon production MT array
14	LSIGP	Table of photon production cross section locators
15	SIGP	Photon production cross sections
16	LANDP	Table of photon production angular distribution locators
17	ANDP	Photon production angular distributions
18	LDLWP	Table of photon production energy distribution locators
19	DLWP	Photon production energy distributions
20	YP	Table of yield multipliers
21	FIS	Total fission cross section
22	END	Last word of this table
23	LUNR	Probability tables
24	DNU	Delayed $\bar{\nu}$ data
25	BDD	Basic delayed data (λ 's, probabilities)
26	DNEDL	Table of energy distribution locators
27	DNED	Energy distributions
	...	
32	—	

4.3 Format of Individual Data Blocks

4.3.1 ESZ Block

The format of the ESZ Block is given in Table 5.

Table 5: ESZ Block.

Location in XSS	Parameter	Description
S_{ESZ}	$E(l), l = 1, \dots, N_E$	Energies
$S_{\text{ESZ}} + N_E$	$\sigma_t(l), l = 1, \dots, N_E$	Total cross section
$S_{\text{ESZ}} + 2N_E$	$\sigma_s(l), l = 1, \dots, N_E$	Total absorption cross section
$S_{\text{ESZ}} + 3N_E$	$\sigma_{el}(l), l = 1, \dots, N_E$	Elastic cross section
$S_{\text{ESZ}} + 4N_E$	$H_{el}(l), l = 1, \dots, N_E$	Average Heating numbers

Note: S_{ESZ} is index of the XSS array where the ESZ Block starts, $\text{JXS}(1)$, and N_E is the number of energy energy points, $\text{NXS}(3)$.

4.3.2 NU Block

There are four possibilities for the NU Block:

1. No NU Block. This happens when $\text{JXS}(2)=0$.
2. Either prompt or total $\bar{\nu}$ is given (but not both). The NU array begins at location $\text{XSS}(\text{KNU})$ where $\text{KNU}=\text{JXS}(2)$.
3. Both prompt and total $\bar{\nu}$ are given. The prompt NU array begins at $\text{XSS}(\text{KNU})$ where $\text{KNU}=\text{JXS}(2)$; the total NU array begins at $\text{XSS}(\text{KNU})$ where $\text{KNU} = \text{JXS}(2) + \text{ABS}(\text{XSS}(\text{JXS}(2)))+1$
4. Delayed $\bar{\nu}$ is given. The delayed $\bar{\nu}$ array begins at $\text{XSS}(\text{KNU})$ where $\text{KNU}=\text{JXS}(24)$. Delayed $\bar{\nu}$ must be given in form b described below.

The format of the NU Block has two forms (if it exists); polynomial (see Table 6) and tabulated (see Table 7). The format is specified by the LNU flag located in the XSS array at index KNU where KNU is defined above.

Table 6: NU Block—Polynomial function form.

Location in XSS	Parameter	Description
KNU	LNU=1	Polynomial function flag
KNU+1	N_C	Number of coefficients
KNU+2	$C(l), l = 1, \dots, N_C$	Coefficients

When using the polynomial function form of the NU array, $\bar{\nu}$ is reconstructed as

$$\bar{\nu}(E) = \sum_{l=1}^{N_C} C(l)E^{l-1}, \quad (1)$$

where the energy, E , is given in MeV.

Table 7: NU Block—Tabulated form.

Location in XSS	Parameter	Description
KNU	LNU=2	Tabulated data flag
KNU+1	N_R	Number of interpolation regions
KNU+2	$\text{NBT}(l), l = 1, \dots, N_R$	ENDF interpolation parameters
KNU+2+ N_R	$\text{INT}(l), l = 1, \dots, N_R$	ENDF interpolation scheme [†]
KNU+2+2 N_R	N_E	Number of energies
KNU+3+2 N_R	$E(l), l = 1, \dots, N_E$	Tabulated energy points
KNU+3+2 $N_R + N_E$	$\bar{\nu}(l), l = 1, \dots, N_E$	Tabulated $\bar{\nu}$ values

[†] If $N_R = 0$, NBT and INT are omitted and linear-linear interpolation is assumed.

If delayed neutron data exist (when $\text{JXS}(24) > 0$), the precursor distribution format is given as in Table 8. The decay constant for the first group DEC_1 is given at $\text{XSS}(\text{JXS}(25))$. The precursor distribution immediately follows as described in Table 8. The indices (locators) of the XSS array where each precursor distribution begins (S_{DNU}) can found using the format described in Section 4.3.17 and Section 4.3.18, where $\text{LED} = \text{JXS}(26)$ and $\text{NMT} = \text{NXS}(8)$.

Table 8: Delayed $\bar{\nu}$ precursor distribution.

Location in XSS	Parameter	Description
S_{DNU}	DEC_i	Decay constant for the i -th group
$S_{\text{DNU}}+1$	N_R	Number of interpolation regions
$S_{\text{KNU}}+2$	$\text{NBT}(l), l = 1, \dots, N_R$	ENDF interpolation parameters
$S_{\text{KNU}}+2+N_R$	$\text{INT}(l), l = 1, \dots, N_R$	ENDF interpolation scheme [†]
$S_{\text{DNU}}+2+2N_R$	N_E	Number of energies
$S_{\text{DNU}}+3+2N_R$	$E(l), l = 1, \dots, N_E$	Tabulated energy points
$S_{\text{DNU}}+3+2N_R + N_E$	$P(l), l = 1, \dots, N_E$	Corresponding probabilities

[†] If $N_R = 0$, NBT and INT are omitted and linear-linear interpolation is assumed.

Note: S_{DNU} is the index of the XSS array where the delayed $\bar{\nu}$ precursor distribution begins; the first one is at $S_{\text{DNU}} = \text{JXS}(25)$.

4.3.3 MTR & MTRP Blocks

The format of the MTR Block (for incident neutron reactions) and MTRP Block (for photon production reactions) is given in Table 10. The starting index depends on whether it is the MTR Block or MTRP Block and are given in Table 9.

Block	LMT	NMT
MTR	JXS(3)	NXS(4)
MTRP	JXS(13)	NXS(6)

Table 9: LMT and NMT values for the MTR Block and MTR Block.

Table 10: MTR & MTRP Block.

Location in XSS	Parameter	Description
LMT	MT_1	First ENDF Reaction available
LMT+1	MT_2	Second sENDF Reaction available
...		
LMT+NMT+1	MT_{NMT}	Last ENDF reaction available

[†] If $N_R = 0$, NBT and INT are omitted and linear-linear interpolation is assumed.

For the MTR Block, MT_1, \dots, MT_{NMT} are standard ENDF MTnumbers; that is, $MT=16=(n, 2n)$; $MT=17=(n, 3n)$; etc. For a complete listing of MT numbers, see [1, Appendix B].

For the MTRP Block, the MT numbers are somewhat arbitrary. To understand the scheme used for numbering the photon production MTs, it is necessary to realize that in the ENDF format, more than one photon can be produced by a particular neutron reaction that is itself specified by a single MT. Each of these photons is produced with an individual energy-dependent cross section. For example, MT102 (radiative capture) might be responsible for 40 photons, each with its own cross section, angular distribution, and energy distribution. We need 40 photon MTs to represent the data; the MTs are numbered 1002001, 1002002, \dots , 1002040. Therefore, if ENDF MT N is responsible for M photons, we shall number the photon MTs $1000*N+1, 1000*N+2, \dots, 1000*N+M$.

4.3.4 LQR Block

The format of the LQR Block, containing the reaction-specific Q -values, is given in Table 11. The index at the start of the LQR Block, $S_{LQR}=JXS(4)$. The number of reactions, NMT, is the same through the ACE Table, $NMT=NXS(4)$.

Table 11: LQR Block.

Location in XSS	Parameter	Description
S_{LQR}	Q_1	Q -value for reaction MT_1
$S_{LQR}+1$	Q_2	Q -value for reaction MT_2
...		
$S_{LQR}+NMT-1$	Q_{NMT}	Q -value for reaction MT_{NMT}

4.3.5 TYR Block

The format of the TYR Block is given in Table 12. The index at the start of the TYR Block, $S_{TYR}=JXS(5)$. The number of reactions, NMT, is the same through the ACE Table, $NMT=NXS(4)$.

Table 12: TYR Block.

Location in XSS	Parameter	Description
S_{TYR}	TY_1	Neutron release for reaction MT_1
$S_{\text{TYR}+1}$	TY_2	Neutron release for reaction MT_2
...		
$S_{\text{TYR}+\text{NMT}-1}$	TY_{NMT}	Neutron release for reaction MT_{NMT}

The possible values of TY are $\pm 1, \pm 2, \pm 3, \pm 4, \pm 19, 0$, and integers greater than 100 in absolute value; the sign indicates the system for scattering: negative=center-of-mass, positive=Lab. Thus if $\text{TY}_i=+3$, three neutrons are released for reaction MT_i and the data on the cross section tables used to determine the exiting neutrons' angles are given in the lab frame of reference. $\text{TY}=19$ indicates fission. The number of secondary neutrons released is determined from the fission $\bar{\nu}$ data found in the NU Block. $\text{TY}_i=0$ indicates absorption (ENDF reactions $\text{MT}>100$); no neutrons are released. $\|\text{TY}_i\| > 100$ signifies reactions other than fission that have energy-dependent neutron multiplicities. The number of secondary neutrons released is determined from the yield data found in the DLW Block. The MT_i s are given in the MTR Block.

4.3.6 LSIG & LSIGP Block

The LSIG Block and LSIGP Block gives the locators for cross section array for each reaction MT. A locator is a *relative* index in the XSS array where some piece of data. In this case, the data is the cross section values. The format of the LSIG Block (for incident neutron cross sections) and LSIGP Block (for photon production cross sections) is given in Table 13. The format for the incident neutron cross section arrays is given in Section 4.3.7. The format for the photon production cross sections is given in Section 4.3.14.

All locators are relative to $\text{JXS}(7)$ for the LSIG Block or $\text{JXS}(15)$ for the LSIGP Block. That is, $\text{LXS}=\text{JXS}(7)$ for the LSIG Block and $\text{LXS}=\text{JXS}(15)$ for the LSIGP Block. So the actual cross section data begins at the index $\text{LOCA}+\text{LXS}$. The MTs are given in the MTR Block and the MTRP Block for the LSIG Block and the LSIGP Block respectively. LOCA_i must be monotonically increasing.

Table 13: LSIG & LSIGP Block.

Location in XSS	Parameter	Description
LXS	$\text{LOCA}_1 = 1$	Location of cross sections for reaction MT_1
$\text{LXS}+1$	LOCA_2	Location of cross sections for reaction MT_2
...		
$\text{LXS}+\text{NMT}-1$	LOCA_{NMT}	Location of cross sections for reaction MT_{NMT}

4.3.7 SIG Block

The SIG Block contains the incident neutron cross section data. (The photon production cross section is in the SIGP Block.) The format of the SIG Block is given in Table 14. The cross section data begins at the index specified by the locator from the LSIG Block; the format for which is given in Table 15.

Table 14: SIG Block.

Location in XSS	Parameter	Description
LXS+LOCA ₁ - 1		Cross section array for reaction MT ₁
LXS+LOCA ₂ - 1		Cross section array for reaction MT ₂
...		
LXS+LOCA _{NMT} - 1		Cross section array for reaction MT _{NMT}

Note: The number of cross section arrays NMT=NXS(4).

The LOCA_i values are given in the LSIG Block and are all relative to JXS(7). The energy grid, $E(K)$ is given in the ESZ Block. The energy grid index IE_i corresponds to the first energy in the grid at which a cross section is given. The MT_is are defined in the MTR Block.

Table 15: Cross section array for the i -th SIG Block.

Location in XSS	Parameter	Description
LXS + LOCA _i -1	IE_i	Energy grid index for reaction MT _i
LXS + LOCA _i	NE_i	Number of consecutive entries for MT _i
LXS + LOCA _i +1	$\sigma_i[E(K)]$ for $K = IE_i, \dots, IE_i + NE_i - 1$	Cross section for reaction MT _i

4.3.8 LAND Block

The format of the LAND Block is given in Table 16.

Table 16: LAND Block.

Location in XSS	Parameter	Description

4.3.9 AND Block

The format of the AND Block is given in Table 17.

Table 17: AND Block.

Location in XSS	Parameter	Description

4.3.10 LDLW Block

The format of the LDLW Block is given in Table 18.

Table 18: LDLW Block.

Location in XSS	Parameter	Description

4.3.11 DLW Block

The format of the DLW Block is given in Table 19.

Table 19: DLW Block.

Location in XSS	Parameter	Description

4.3.12 GPD Block

The format of the GPD Block is given in Table 20.

Table 20: GPD Block.

Location in XSS	Parameter	Description

4.3.13 MTRP Block

The format of the MTRP Block is given in Table 21.

Table 21: MTRP Block.

Location in XSS	Parameter	Description

4.3.14 SIGP Block

The format of the SIGP Block is given in Table 22.

Table 22: SIGP Block.

6 Thermal Scattering $S(\alpha, \beta)$

6.1 NXS Array

6.2 JXS Array

7 Continuous-Energy Photon

7.1 NXS Array

Table 34: NXS array element definitions for NXS ACE Table.

Element	Name	Description
1	—	Length of second block of data (XSS array)
2	Z	Atomic number
3	NES	Number of energies
4	NFLC	Length of the fluorescence data divided by 4
5	NSH	Number of electron shells
	...	
16	—	

7.2 JXS Array

Table 35: JXS array element definitions for JXS ACE Table.

Element	Name	Location Description
1	ESZG	Energy table
2	JINC	Incoherent form factors
3	JCOH	Coherent form factors
4	JFLO	Fluorescence data
5	LHNM	Heating numbers
6	LNEPS	Number of electrons per shell
7	LBEPS	Binding energy per shell
8	LPIPS	Probability of interaction per shell
9	LSWD	Array of offsets to the shell-wise data
10	SWD	Shell-wise data in PDF and CDF form
	...	
32	—
